

Will the vaccine protect me completely?

Most people who have the vaccine will not get flu. However, like any vaccine, it does not give you 100% protection. The majority of people will be fully protected, some will get milder flu symptoms but a small number may still get flu.

When should I have the vaccine?

As soon as possible - it will be available free of charge from October 2011 to all pregnant women and will protect you throughout this year's flu season.

Where can I get the vaccine?

The vaccine is available from your local GP practice. Please do not be complacent or wait until there is a flu outbreak this winter - talk to your midwife or GP today and book an appointment.

What should I do if I think I have flu?

Contact your GP urgently as you may need help fighting off the virus with some antiviral treatment.

Flu Protect yourself and others

To find out more about the flu vaccine flu vaccine, please contact your GP practice, speak to your midwife or visit www.nhs.uk

Please don't delay – make sure you get the vaccine today to protect yourself, your baby and your loved ones.

How to get in touch

If you have any further queries you can contact: Patient Advice and Liaison Service (PALS)

FREEPHONE: 0800 279 2535

Telephone: 01223 725 588

Email: c-pct.pals@nhs.net

Pregnancy and Flu

Important information for pregnant women about the seasonal flu vaccine

What is flu?

Seasonal flu happens every year, usually in the winter. It is a highly infectious disease caused by a virus and spreads easily from person to person.

Flu is far more serious than a cold. Symptoms hit you suddenly and severely and usually include fever, chills, headaches and aching muscles - you can often get a cough and sore throat at the same time.

A vaccine is available every year to protect those people who are most at risk of complications if they catch flu. This includes pregnant women.

What does the vaccine protect against?

The vaccine will protect against three strains of the flu virus, including the H1N1 strain which caused the swine flu pandemic in 2009 and which continued to circulate last year.

Every year, the most likely strains of flu that are expected to cause illness are identified in advance by the World Health Organization. The vaccine is then produced and made available in October.

Why do pregnant women need the vaccine?

Pregnant women are particularly at risk from the H1N1 strain of the flu virus which is expected to be circulating again this winter. Pregnant women who catch flu, in particular H1N1, are at increased risk of serious complications such as bronchitis and pneumonia. H1N1 infection in the mother affects the baby too. You could risk premature or still birth by not having the vaccine.

Over the past two years a significant number of normally fit and well pregnant women have been critically ill in hospital suffering from flu - sometimes with devastating consequences.

This can be prevented by having the vaccine to help you stay well and to protect your family.

What are the risks of flu to me and my baby?

Flu can cause serious illness in pregnant women and in the most severe cases can put the lives of expectant mums, and the lives of unborn babies, in unnecessary danger.

As a pregnant woman you are at risk of serious complications from flu. This is because your body and immune system are adapting to accommodate your growing baby so are less able to fight off the flu virus.

Is the vaccine safe for pregnant women?

Yes - it is safe for you and your baby and can be given at any stage of pregnancy. The earlier you have the vaccine the better as this means you will be protected for the whole winter. The vaccine may also give your unborn baby some protection against flu during the first six months of life.

How does the vaccine work?

There are NO live viruses and the vaccine CANNOT give you the flu. The vaccine works by tricking your immune system into thinking it has been infected with the flu virus so that it creates antibodies against it. These antibodies help to protect you and your baby against seasonal flu viruses that you may come into contact with.

About a week to ten days after you have had the flu vaccine, your body starts making antibodies to fight off what it thinks is a virus in the vaccine. If you are then exposed to flu, your immune system will destroy the virus before it can cause any serious illness.

Is there anyone who shouldn't have the vaccine?

Almost everybody can have the vaccine, but you should not be vaccinated if you have had a serious allergy to the vaccine in the past. If you have a serious allergy to hens' eggs you can still be vaccinated under specialist clinical supervision.

If you have a fever the vaccination may be delayed until you are better.
